

Website Redesign Proposal: Mahendras Online Website

Introduction

Mahendra's Educational Private Limited is a very famous name for government exam preparation in India. The institution has over 150 coaching centres in many cities and towns, and lakhs of students trust it. But while the offline business is great, the official website looks very old. It looks like a crowded school notice board rather than a modern online learning website.

Right now, new companies like Testbook and Adda247 are winning online because their websites are very clean and easy to use. The Mahendras website gets a lot of free traffic from Google because it uploads daily current affairs and exam news. But this traffic is being wasted because visitors leave the site without buying any courses. This proposal explains the main problems on the website and gives a simple plan to fix them so more online courses and test series can be sold.

Part 1: Website Audit (What is Broken?)

1. Crowded Layout and Confusing Homepage

- **Too Much Information:** The homepage has too many things happening at the same time. There are flashing text links, moving banners, and multiple sidebars. A student gets confused about where to click.
- **Hard to Buy Courses:** If a student wants to buy a new Online Live Batch or check the price of a test series, they have to scroll past huge blocks of text. Important buttons like "Buy Now" or "Watch Free Demo" are hidden at the bottom.

2. Confusing Menu Links

- **Too Many Choices:** The top menu bar is completely packed. It shows 17 different links like Home, About Us, Blogs, News, Learning, Exam Notifications, Upcoming Exams, Events, Gallery, Careers, Offline Centres, Online Batches, Student Login, and more.
- **The Result:** Because there are too many options, students get tired of looking at the menu and close the website.

3. Poor Mobile Experience and Slow Loading

- **Bad for Mobile Users:** More than 80% of students from small towns study using their mobile phones. The current website does not fit well on small mobile screens. The links are too small and very close to each other, making it hard to tap them accurately with a thumb.

- **Slow Speed:** The website takes too much time to load on normal 4G and 5G mobile networks because the images are not compressed and there is too much heavy code behind the pages.

4. Wasting Free Traffic

- **Dead Ends on Pages:** The daily blog pages like Daily Current Affairs get thousands of views from Google search. But once a student finishes reading the current affairs, the page just ends. There is no simple button or banner on the side saying: "Liked these questions? Buy the Daily Banking Mock Test Pack for Rs. 99." The site is giving out free information but getting no sales in return.

Part 2: The UI/UX Redesign Plan (How to Fix It)

The messy notice-board style must be removed to divide the website into 3 simple sections or hubs.

The first section is the Learning Hub, which is for finding online batches, buying video courses, and locating physical coaching centres. The second section is the Practice Hub, which houses all mock tests, speed tests, and daily quizzes. The third section is the Update Hub, which is dedicated to official exam dates, admit cards, and daily current affairs notes. A big search box will sit at the top of the clean homepage, asking students exactly which exam they want to search for.

Direct Comparisons: Old Website vs. New Design

Website Feature	How it looks now (Old)	How it will look after redesign (New)
Top Header / Main Banner	Crowded with moving text alerts and low-quality graphics.	Clean Search Bar: A big search box that asks: <i>"Which exam are you preparing for today? (e.g., SBI PO, SSC CGL)"</i> .
Course Pages	Plain text descriptions that ask users to fill out a long form just to see the class timings.	Modern Course Cards: Clean boxes showing the duration, teacher's photo, price, and a quick "Watch 5-Min Demo" button.
Student Reviews	Old text quotes hidden deep inside the "Awards Gallery" page.	Video Testimonials: A neat row of short videos of successful students sharing their

		stories (e.g., <i>"How Amit from Patna cleared the bank exam"</i>).
Student Marks Card	Simple text showing right and wrong answers with a basic answer key.	Smart Report Cards: Colorful pie charts and line graphs showing the student's speed, weak topics, and rank comparison with others.

Part 3: Simple Marketing Tricks to Increase Sales

To turn regular visitors into paying customers, the website needs to guide students step-by-step through an active marketing funnel:

- **Pop-Up Quizzes on Free Pages:** When a student reads the Daily Current Affairs page, a small box should appear on the side saying: "Test your memory! Play today's 5-minute current affairs quiz." To see the score, the student will enter a mobile number and email. This gives the sales team a fresh contact lead.
- **Ad Tracking (Remarketing Pixels):** If a student spends time reading the SBI PO Exam Analysis page but leaves without buying anything, they will be tracked using basic ad codes. The next time they open Facebook, YouTube, or Instagram, they will see ads showing top teachers solving SBI PO questions.
- **Creating Urgency:** On course checkout pages, live countdown clocks should be added (e.g., "Discount ends in 3 hours — Only 5 seats left in Uttar Pradesh"). This makes students buy quickly instead of waiting.

Part 4: Technology & Safe Launch Plan

1. Technology Choices

- **Modern Coding Framework:** Build the front of the website using React.js or Next.js. This helps pages load instantly, even on weak mobile internet connections in village areas.
- **Strong Database:** Use PostgreSQL for the backend database so the website does not crash when lakhs of students check their results at the same time.
- **Fast Content Delivery (CDN):** Use Cloudflare to save copies of text and images on nearby servers across India so pages open fast anywhere.

2. The 10-Week Timeline

The website will change slowly in stages so that current students do not face any technical issues:

- Weeks 1–2 (Planning): Draw simple sketches of the new pages on paper. Show them to a few students at local branches to see if they find the pages easy to use.
- Weeks 3–5 (Building): Write the code for the new pages, design the video player, and create the new student dashboard.
- Weeks 6–8 (Testing): Launch a hidden test website (beta.mahendras.org) only for offline centre students. Find and fix any broken buttons or bugs.
- Weeks 9–10 (Final Launch): Double-check everything on mobile screens and launch the new website for the public.

3. Keeping Google Rankings Safe (SEO Protection)

Mahendras comes on the first page of Google for terms like "current affairs notes" and "exam notifications". If the website is changed incorrectly, all this free Google traffic could disappear. Three things must be done:

- Do Not Change Important URLs: Keep the exact same link structure for old popular blogs (like mahendras.org/blogs/sbi-po-exam-analysis).
- Use 301 Redirect Links: If an old page is deleted or moved, create an automatic redirect link so that anyone clicking the old link goes directly to the new page.
- Keep the Useful Information Text: Even though the new design will be clean with more images, all the detailed educational text must be kept so that Google continues to rank the site high.
